Where the value sits

Forecast

Revenue trend

Executive Summary

Revenue is steady at about $34,500 a month. The biggest opportunity is keeping high-value customers who have gone quiet.

Key takeaways

- Revenue totals $2.59M from 20,497 delivered orders, with an average order of $126.
- Revenue is flat: no growth trend and no seasonal pattern. Q1 2026 is up 17.7% on Q1 2025, but the typical order value did not change significantly (p = 0.14), so treat it as encouraging, not proven.
- 8.9% of customers have churned, and 8.6% of booked orders were returned.
- At Risk customers are 24% of the customer base but hold 35% of lifetime spend.
- Existing customers should bring in about $379k over the next 12 months.

Visual notes

- KPI cards: "Revenue YoY % compares the latest year to date with the same dates last year."
- Revenue trend: Monthly revenue (dark line) moves between about $26k and $45k with no lasting rise or fall. The grey line is the 3-month average.
- Segment bar: "At Risk, Champions and Loyal customers hold 89% of lifetime spend."
- Forecast: "The best-tested model is a flat level: about $34,490 a month, with a 95% range of $27.7k to $41.3k. On the last 6 months it missed by 14% on average, and it beat models that assume trend or seasonality."

Churn, customer value and the segment chart come from the customers table, so they do not respond to the year or category slicers.

Revenue

2026 so far

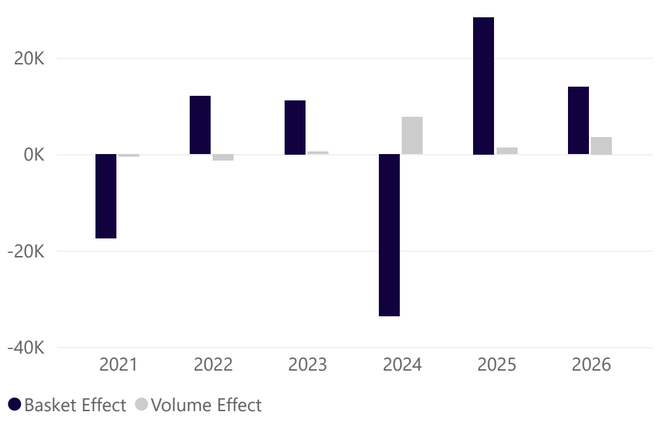

Revenue YTD
116.15K

Revenue YTD LY
98.73K

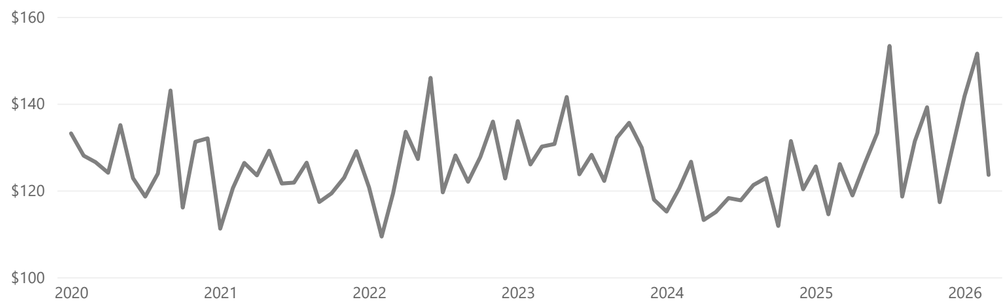

year
All

Revenue does not trend and does not follow seasons or weekdays. Year-to-year changes come from order size, not the number of orders.

Revenue by year

year	Revenue	Revenue LY	Revenue YoY %	Orders	AOV
2020	$417,179.86			3264	$128
2021	$399,253.07	$417,180	-4.30%	3260	$122
2022	$409,932.27	$399,253	2.67%	3249	$126
2023	$421,589.22	$409,932	2.84%	3253	$130
2024	$395,660.32	$421,589	-6.15%	3312	$119
2025	$425,357.93	$395,660	7.51%	3323	$128
2026	$116,153.83	$98,728	17.65%	836	$139

Key takeaways

- Yearly revenue stays between $396k and $425k ($417k in 2020, $425k in 2025).
- Order count is almost constant at 3,249 to 3,323 orders a year.
- Average order value moved between $119 and $130, which explains most yearly changes: -6.2% in 2024 and +7.5% in 2025. Even these AOV differences are not statistically clear (p = 0.09).
- To 30 March 2026, revenue is $116k against $98.7k for the same dates of 2025 (+17.7%). Orders are up 3.6%, but the typical order value is not significantly different (p = 0.14).

Visual notes

- Year table: "Revenue LY is blank for 2020 because there is no earlier year. 2026 is compared with the same dates of 2025."
- Basket and volume: Revenue moves with basket size (dark bars), not with the number of orders (grey bars). The two bars add up to each year's change in revenue.
- AOV trend: "Average order value swings from month to month with no lasting trend."
- Heatmap: "Darker means higher revenue. No month stands out consistently, and seasonal differences are not statistically significant (p = 0.98). Blank cells are months with no data yet."
- Day of week: "Revenue is spread evenly across the week (p = 0.76)."
- YTD cards: "Year to 30 March 2026 against the same period of 2025."

Customers and CLV

Total Customers	Lifetime Spend	Avg Lifetime Spend	Top 20% Spend Share	Predicted Revenue 12m
8,000	$12.4691388M	$1,559	60.98%	$379,343

A small group of customers holds most of the value: the top 20% hold 61% of lifetime spend, and three segments hold 89%.

Customers vs spend

Value vs recency

Avg Lifetime Spend by Tier

Key takeaways

- 8,000 customers with $12.47M of lifetime spend, an average of $1,559 each.
- Champions are 16% of customers and hold 30% of spend. Loyal customers are 20% and hold 24%. At Risk customers are 24% and hold 35%.
- At Risk customers average 24 orders and $2,280 of spend, but have not bought for about 115 days.
- Hibernating and New / Promising customers are 32% of customers but only 9% of spend.
- Platinum customers spend the most (about $2.6k on average, against about $1.4k for Free and Silver).
- Existing customers are expected to spend about $379k over the next 12 months.

Visual notes

- Segment table: "Segments are built from each customer's full history: how recently they bought (days since last purchase), how often (total orders) and how much (total spend)."
- Customers vs spend: "Share of customers against share of spend. At Risk, Champions and Loyal take a larger share of spend than of customers."
- Value vs recency: "At Risk customers are nearly as valuable as Champions ($2,280 against $2,879 on average) but have been inactive for about 115 days instead of 13."
- Tier chart: "Average lifetime spend differs by membership tier, and the difference is statistically real."
- Predicted revenue card: "Expected revenue from existing customers over the next 12 months. This is reliable as a total. Forecasts for individual customers are not reliable (hold-out test)."

This page uses the customers table (full purchase history), so date slicers do not apply. Individual future spend could not be predicted from order history, so segments describe past behaviour.

C03360	At Risk	16.6%	$8,656.56	16	148
C03614	At Risk	21.8%	$3,627.64	16	186
C04132	At Risk	18.5%	$4,040.91	22	207
C04432	Champions	18.7%	$61,282.48	67	26
C04534	At Risk	18.4%	$6,541.22	25	197
C04744	At Risk	23.5%	$5,141.76	45	385

Churn is 8.9% and is linked to low engagement, not to country, channel, device or demographics. Frequent buyers rarely leave.

Key takeaways

- 715 customers have churned.
- Churned customers placed about half as many orders (median 7 against 13), spent about half as much ($460 against $883) and left fewer reviews (1 against 2).
- Hibernating customers churn at 15.7%, more than three times the rate of Champions (4.6%).
- With the same inactivity of about 115 days, At Risk customers churn at 8.5% against 15.7% for Hibernating customers. Frequent buyers drift away less.
- Country, channel, product category, device, payment method, gender and age show no significant difference in churn.
- 800 customers are in the high-risk band. The ones still active hold about $562k of lifetime spend.

Visual notes

- Churn by tier: "A small but real tier effect: Silver about 7%, Gold and Free about 10%."
- Risk bands: "High means the riskiest 10% of customers according to the model (about 800 customers). The bands are relative, not absolute probabilities."
- Churned vs active table: "Medians show the typical customer. Churned customers have fewer orders, lower spend, fewer reviews and a longer time since their last purchase."
- Churn by segment: "Hibernating and Needs Attention customers churn most. Champions and Loyal customers churn least."
- Call list: "Highest-value active customers in the high-risk band: a starting list for win-back outreach."
- Risk model note: "The risk score comes from a model with ROC-AUC 0.65. The riskiest 10% churn about 2.5 times the average rate. Use it to rank who to contact first, not to predict individual customers."

Recommended action: Test a win-back offer on part of the At Risk group and keep a comparison group, so the real effect can be measured.

Recency and the churn flag are measured at the same point in time, so these results show association, not cause. Lifetime orders and spend are totals to date, so customers who left early had less time to build them.

Products and discounts

Discount Amount	Discount Rate %	Discounted Order %
$149,322	5.45%	35.02%

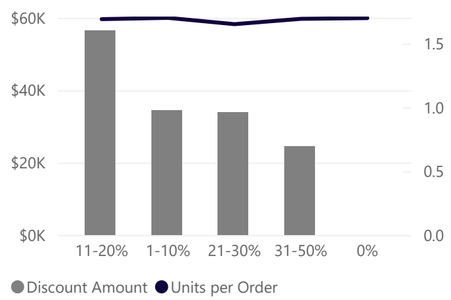

year: All

category: All

Discount band table

discount_band	Booked Orders	Units per Order	Booked AOV	Return Rate %	Discount Amount	Discount Cost per Order

Total	**23,544**	**1.70**	**125.68**	**8.58%**	**$149,322**	**6.34**

Discount cost chart

Discounts cost 5.45% of sales with no visible increase in basket size. Sales are moderately concentrated in 62 products.

Key takeaways

- $149,322 of discounts were given, on 35% of booked orders.
- Units per order stay at about 1.7 at every discount level (p = 0.26), and returns and ratings do not change.
- Deep discounts cost the most per order: $9 at 1 to 10% off, rising to $46 at 31 to 50% off. Orders above 20% off are 7% of orders but 39% of discount cost.
- Customers whose first order was discounted churn slightly more (10% against 8%), but the result is only borderline after correcting for multiple tests (adjusted p = 0.05).
- 62 of 140 products (class A) make 80% of booked sales. Electronics is the largest category at about $1.1M.
- No product has a rating or return rate that is statistically different from the rest.

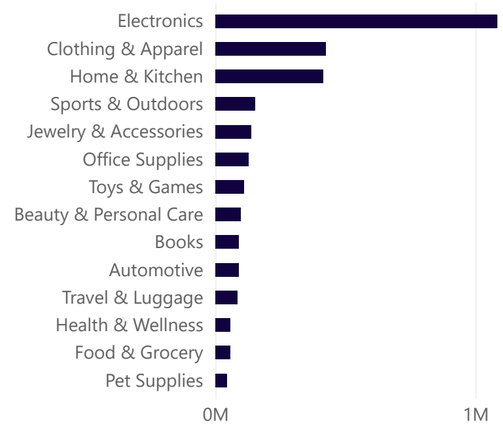

Visual notes

- Discount table: "Discount cost per order rises from $9 to $46 while units per order stay flat."
- Discount chart: "Bars show discount cost by band. The line shows units per order, which does not rise with deeper discounts."
- Pareto: "The 10 best-selling products, with the cumulative share of total booked sales."
- ABC table: "A = products making the first 80% of sales, B = the next 15%, C = the last 5%."
- Category chart: "Electronics, Clothing & Apparel and Home & Kitchen lead booked sales."

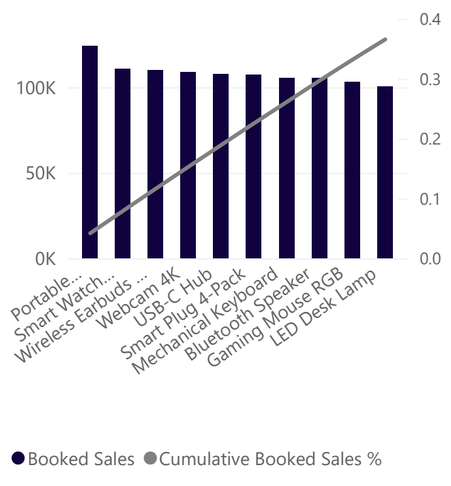

Product summary

abc_class	Products	Booked Sales
A	62	2,363,476.31
B	48	441,168.67
C	30	154,349.43
Total	**140**	**2,958,994.41**

Booked Sales
by category

Pareto

This data shows whether discounts change basket size. It cannot show whether they bring extra visits or orders. A controlled test (some customers get the offer, some do not) would answer that. This page uses booked sales (all orders except cancelled), to match the product summary table.

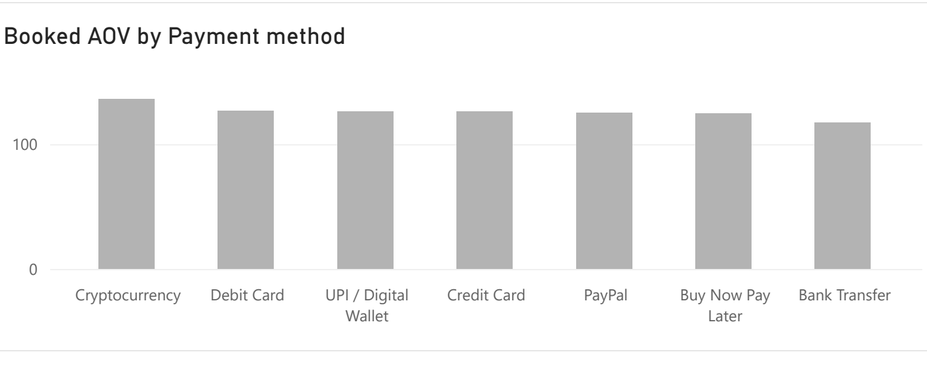

Returns and delivery

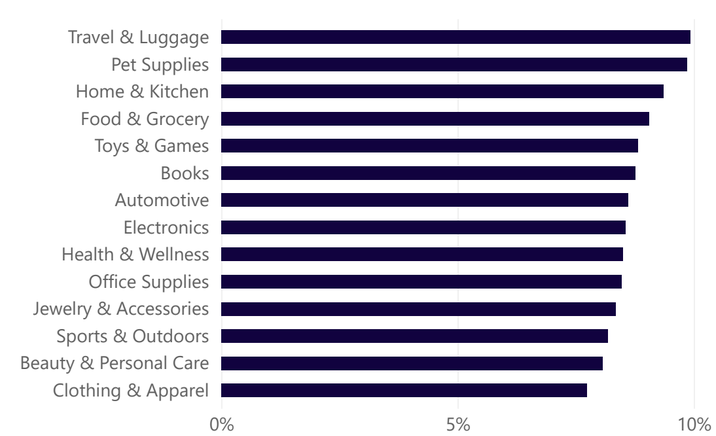

Return Rate %	Returned Orders	Returned Revenue	Avg Delivery Days	On-time %	Avg Rating
8.58%	2,020	$253,709	4.2	67.52%	4.00

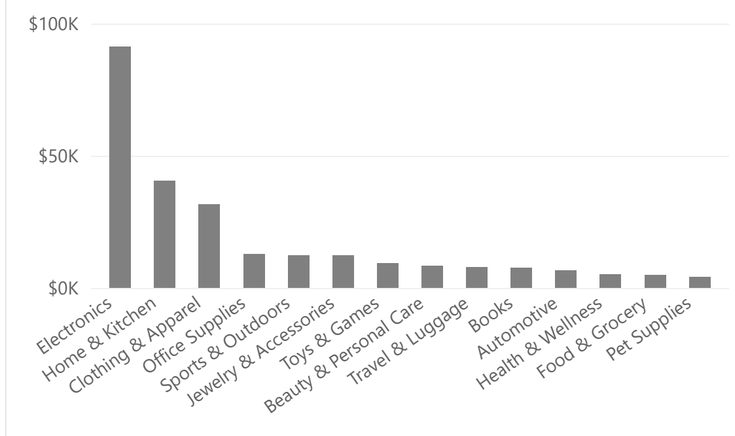

SLA Days: All

Delivery bands

delivery_band	Booked Orders	Avg Rating	Return Rate %
0-2 days	5,418	3.99	8.66%
3-4 days	10,491	4.01	8.73%
5-6 days	3,515	4.00	8.19%
7+ days	4,120	4.00	8.42%
Total	**23,544**	**4.00**	**8.58%**

Returns are uniform across categories and unrelated to delivery speed. The dollar value of returns simply follows sales volume.

Key takeaways

- 2,020 orders were returned (8.6% of booked orders), worth $253.7k.
- Return rates are between 8% and 10% in every category (p = 0.72).
- Electronics ($91k), Home & Kitchen ($41k) and Clothing & Apparel ($32k) make up 64% of returned value, because they are the biggest categories.
- Delivery speed does not affect satisfaction: ratings are about 4.0 and return rates 8% to 9% in every delivery band, including the 17% of orders that take 7 or more days (p = 0.79).
- Average delivery takes 4.2 days, and 67.5% of orders arrive within 4 days.
- Order value does not differ by payment method (p = 0.66).

Visual notes

- Return rate by category: "Every category sits between 8% and 10%."
- Returned revenue: "Dollar value follows sales volume, not return behaviour."
- Delivery table: "Customers rate slow and fast deliveries alike."
- SLA slider: "Pick a delivery promise in days to see the share of orders that would meet it."
- Payment chart: "Differences between payment methods are not statistically significant."

Recommended action: Treat returns as a company-wide issue, not a category issue.

Every number in this report reconciles to the official tables, and every claim was tested before being included.

Key takeaways

- Revenue and orders for every month match the official monthly table, with a difference of 0.
- Booked orders match the product summary table (difference 0).
- The best forecast model is a flat level: about $34,490 a month with a 14.15% average error on the last 6 months. A simple 12-month average scored 13.4%, so more complex models did not help.
- Only a few effects are real: churn is linked to orders, spend, reviews and returns; membership tier; the customer segments; and lifetime spend by tier. All other factors tested show no difference.
- There is no cost or marketing spend data, so profit and return on ad spend cannot be calculated. The 30% margin used for CLV is an assumption.
- Many factors were tested and found to make no difference. Those are results, not gaps.

Visual notes

- Forecast cards: "Model chosen from four candidates by testing on the last 6 months. MAPE is the average percentage miss."
- Reconciliation table: "Source is the official monthly table. Model is this report. The difference is 0.00 in every month."
- Product check: "Difference between booked orders in the model and the product summary table. 0 means they agree."
- Test results table: "The p-value is the chance a difference is just luck. The adjusted p-value corrects for running many tests. Only rows with significant_adj = True are real differences."
- Data decisions table: "Every data issue found, how many rows it affected, and what was done about it."

Recommended actions:

1. **Plan on flat revenue** of about $34.5k a month, with a range of $27.7k to $41.3k.
2. **Run a win-back test** on the 1,919 At Risk customers, with a comparison group.
3. **Test discounts in a controlled way.** They cost 5.45% of sales with no visible lift in basket size.
4. **Do not move budget between channels** on value grounds. No channel was better.
5. **Treat returns as a company-wide issue.** No category stands out.
6. **Collect cost and acquisition spend data** so profit and return on ad spend can be measured.
